

# MACH-ETH Gateway Communication Protocol Specification

For firmware v1.9

MACH SYSTEMS s.r.o.  
[www.machsystems.cz](http://www.machsystems.cz)

## Changes

Date	Firmware Version	Change	Changed by
28.6.2024	1.9	DHCP possibility added to Ethernet configuration Communication protocol also available over RS-232	KH
23.4.2024	1.8	Baud rate of 10417 Bd added to LIN configuration	PK
11.4.2024	1.7	ETH parameters change clarification	KH
11.3.2024	1.7	CAN UDS transport (ISO-TP) protocol added	KH
1.2.2024	1.7	LIN UDS transport protocol added	KH
26.9.2023	1.6	Update for firmware 1.6 – LIN wake up signal detection	PK
6.9.2023	1.5	IP and MAC address format clarification. Added device settings communication example	KH
1.3.2023	1.5	Update for firmware 1.5 – LIN error, LIN messages split into RX and TX, change response message structure, add channel info to CAN response	PK
11.1.2023	1.4	Update for firmware 1.4 – LIN new error type	PK
22.9.2022	1.3	Update for firmware 1.3 – UDP server, default gateway Document clarifications	PK, KH, MM
16.5.2022	1.0	CAN frame timestamp; CAN start and stops commands modified so that both CAN channels can be started by a single command	PK
11.3.2022	1.0	Fixes and clarifications	PH, MM
13.1.2022	1.0	Initial release	PK, KH, MM

## 1. Introduction

The MACH-ETH is a device that can realize an interface for accessing LIN and CAN(/FD) channels over Ethernet or USB. This document describes a binary protocol used over Ethernet TCP/IP, UDP and USB VCP.

The communication protocol allows to:

- Configure CAN(/FD) channels and transmit and receive frames
- Configure LIN channel and transmit and receive frames
- Transmit and receive LIN diagnostic messages over LIN transport protocol (ISO 17987-2 / LIN 2 Transport Layer)
- Transmit and receive CAN(/FD) diagnostic messages over CAN ISO-TP protocol (ISO 15765-2)
- Change the device's configuration
- Read analogue inputs
- Write digital outputs

## 2. Communication Protocol

The communication between the MACH-ETH and a user system is based upon a binary protocol over Ethernet / USB / RS-232. The same message structure is used for both directions - to and from the device.

The protocol consists of Start Byte, Message Id, Data length, Data bytes, Checksum, and End Byte.

**USB configuration is fixed:** Virtual COM port (VCP), 115200 Baud, 8 data bits, no parity, 1 stop bit.

**RS-232 configuration:** default 115200 Baud, 8 data bits, no parity, 1 stop bit. Baud rate can be changed through device's web server.

**Ethernet default:** IP address 192.168.1.100, subnet mask 255.255.255.0, port 8000

The server runs TCP/IP and UDP and its configuration can be reconfigured.

This can be changed directly from the protocol or, as there is a web server running, also via a web browser (we recommend Google Chrome).

STX (1B)	ID (1B)	DATALEN (2B)	DATA (X B)	CHECKSUM (1B)	ETX (1B)
0x02	Message ID	Number of data bytes (LSB first)	Data bytes Number of bytes = DATALEN	1-byte sum (e.g. mod 256) of ID, DATALEN and all DATA bytes	0x03

The rest of the documentation refers to **DATA** part only. The user is then responsible for encapsulating it with the rest of the protocol fields, namely STX, ID, DataLen, Checksum, and ETX. Checksum calculation example:

STX	ID	DATELEN		DATA		CHECKSUM	ETX
0x02	0x01	0x02	0x00	0xFF	0x01	0x03 = (0x01 + 0x02 + 0x00 + 0xFF + 0x01) mod 256	0x03

## 2.1. Message Overview

The following tables describes message of the communication protocol over Ethernet / USB.

Message ID	Name	Request Data Length (bytes)	Response Data Length (bytes)	Description
0x01	BOOT_UP	- (no request needed)	0B ACK	A notification that the gateway was powered up. Sent to USB only.
<b>Product information</b>				
0x11	READ_SN	0	4	Read device serial number
0x12	READ_HW_INFO	0	6	Read device HW info
0x13	READ_SW_INFO	0	2	Read device SW info
<b>Device configuration</b>				
0x14	ETH_RESET_CONFIGURATION	0	0B ACK	Restore the default communication configuration (see Communication Protocol)
0x15	ETH_READ_CONFIGURATION	0	13	Read configuration
0x16	ETH_WRITE_CONFIGURATION	7	0B ACK	Write configuration
0x17	ETH_READ_IP_ADDRESS	0	5	Read IP address and mask
0x18	ETH_WRITE_IP_ADDRESS	5	0B ACK	Write IP address and mask
0x19	ETH_READ_PORT	0	2	Read communication port
0x1A	ETH_WRITE_PORT	2	0B ACK	Write communication port
0x1B	ETH_READ_MAC_ADDRESS	0	6	Read MAC address
0x1C	ETH_READ_DEFAULT_GW	0	4	Read default gateway
0x1D	ETH_WRITE_DEFAULT_GW	4	0B ACK	Write default gateway
0x1E	ETH_DHCP	1	0B ACK or 1	Enable / disable the DHCP client
<b>LIN configuration</b>				
0x20	LIN_WRITE_CONFIGURATION	1	0B ACK	Configure LIN channel
0x21	LIN_READ_CONFIGURATION	0	1	Read LIN channel configuration
0x22	LIN_SAVE_CONFIGURATION	0	0B ACK	Save LIN configuration to EEPROM
0x23	LIN_LOAD_CONFIGURATION	0	0B ACK	Load LIN configuration from EEPROM
0x24	LIN_DEFAULT_CONFIGURATION	0	0B ACK	Load LIN default configuration
0x30	LIN_START	0	0B ACK	Start LIN channel
0x31	LIN_STOP	0	0B ACK	Stop LIN channel
0x32	LIN_ECHO_CONF	1	0B ACK	Configure LIN echo
0x33	LIN_ERROR	N/A	2	LIN bus error
0x40	LIN_MASTER_RESPONSE_TX	3 to 10	0 to 10	Transmit LIN Header + Response <i>Available when the device is configured as a Master</i>
0x41	LIN_MASTER_REQUEST_TX	1	0B ACK	Transmit LIN Header <i>Available when the device is configured as a Master</i>
0x42	LIN_MASTER_REQUEST_RX	N/A	4 to 10	Receive Slave Response <i>Available when the device is configured as a Master</i>

0x45	LIN_DIAG_TIMING	4	0B ACK	Set LIN UDS timing
0x46	LIN_DIAG_REQUEST	1 to 20	0B ACK	Transmit LIN UDS request
0x47	LIN_DIAG_RESPONSE	-	1 to 20	Asynchronous LIN UDS response
0x50	LIN_SLAVE_RESPONSE_CONFIG	2 to 10	0B ACK	Configure Slave Response buffer
0x51	LIN_SLAVE_RESPONSE_TX	N/A	2 to 11	A Slave response transmitted onto the bus.
0x52	LIN_SLAVE_RESPONSE_RX	N/A	2 to 11	A Slave response received from the bus.
0x53	LIN_EVENT	N/A	1	Event on LIN bus. Currently, the wake up signal only.
<b>CAN configuration</b>				
0x60	CAN_WRITE_CONFIGURATION	6	1B ACK	Configure CAN channel
0x61	CAN_WRITE_CONFIG_TIM	9	1B ACK	Configure CAN channel set time quanta
0x62	CAN_READ_CONFIGURATION	1	13	Read CAN channel configuration
0x63	CAN_SAVE_CONFIGURATION	1	1B ACK	Save CAN configuration to EEPROM
0x64	CAN_LOAD_CONFIGURATION	1	1B ACK	Load CAN configuration from EEPROM
0x65	CAN_DEFAULT_CONFIGURATION	1	1B ACK	Load CAN default configuration
0x66	CAN_ECHO_CONF	2	1B ACK	Enable/Disable Tx echo
0x67	CAN_START_CHANNEL	1	1B ACK	Start CAN channel
0x68	CAN_STOP_CHANNEL	1	1B ACK	Stop CAN channel
0x69	CAN_GET_TIMESTAMP	1	9	Get time in microsecond from startup of channel
0x6A	CAN_TRANSMIT_FRAME	5 to 71	1B ACK	Send CAN message
0x6B	CAN_RECEIVED_FRAME	N/A	13 to 79	Received CAN message
0x6C	CAN_ERROR_FRAME	N/A	10	Some error on CAN bus
0x70	CAN_DIAG_RX_CONFIG	8	1B ACK	Set DoCAN RX configuration
0x71	CAN_DIAG_TX_CONFIG	7	1B ACK	Set DoCAN TX configuration
0x72	CAN_DIAG_CHANGE_RX_STATE	2	1B ACK	Enable / disable parsing of DoCAN messages and set P2 <sub>CAN_Client</sub>
0x73	CAN_DIAG_REQUEST	3 to 400	1B ACK	Transmit a diagnostic request
0x74	CAN_DIAG_RESPONSE	N/A	3 to 400	Diagnostic response was received
0x75	CAN_DIAG_TIMEOUT	N/A	1	Diagnostic response timeout
<b>I/O control</b>				
0xE0	IO_WRITE	1	0B ACK	Toggle digital output
0xE1	IO_READ	0	2	Read analog input
<b>Miscellaneous</b>				
0xFD	RESTART	0	0	Restart the device
0xFE	RESTART_BOOT	1	0	Restart gateway to USB / web bootloader
0xFF	GENERAL_ERROR	N/A	2 to 3	An error occurred, see Error Codes for description.

## 2.2. Error Codes

The following tables describes error codes

Error Code	Data length	Comment
<b>Communication protocol errors</b>		
Messages contain: Error Code and Message ID		
0xA0	2	Incorrect end byte on the Ethernet protocol
0xA1	2	Bad checksum on the protocol
0xA2	2	Unknown message ID
0xA3	2	Too large or incorrect data length
<b>LIN bus errors</b>		
Messages contain: Error Code, Message ID and Channel Number		
0xB3	2	Buffer Full
<b>General Bus errors</b>		
Messages contain: Error Code, Message ID and Channel Number		
0xF0	2-3	Configuration Error
0xF1	2-3	Channel running, channel should be stopped when is configure
0xF2	2-3	Invalid channel selected – index out of bounds
0xF3	2-3	Channel is not running
0xF4	2-3	Hardware FIFO is full (should not happen in normal operation)

### 3. Message Specification

#### 3.1. General Response

Device responds with a message acknowledgment after receiving a valid message. The acknowledgment does not contain any data. If there is some problem, the response is Error Response.

#### 3.2. Error Response

**MessageID = 0xFF**

Device responds with an error if the command could not be processed correctly. Message ID contains ID of the requesting message. If Channel number is relevant, error response is three-byte and last byte is number of the relevant channel.

Response:

DATA 0	DATA 1
Error code	Message ID

When Channel number is not relevant.

OR

DATA 0	DATA 1	DATA 2
Error code	Message ID	Channel number

When both Message ID and Channel number are relevant.

See the table above to determine which error message contains what information.

#### 3.3. Device Messages

##### 3.3.1. Device Serial Number

**MessageID = 0x11**

This command is used for reading device serial number.

Request:

No data

Response:

DATA 0 – DATA 3
Device serial number

*Example S/N: 02030106*

DATA 0	DATA 1	DATA 2	DATA 3
06	01	03	02

##### 3.3.2. Device Hardware Information

**MessageID = 0x12**

This command is used for reading device hardware number.

Request:

No data

Response:

DATA 0 – DATA 5
Device hardware number

*Example HW Info: 000400030002*

DATA 0	DATA 1	DATA 2	DATA 3	DATA 4	DATA 5
--------	--------	--------	--------	--------	--------

02	00	03	00	04	00
----	----	----	----	----	----

### 3.3.3. Device Software Information

#### MessageId = 0x13

This command is used for reading software version number.

Request:

No data

Response:

DATA 0	DATA 1
VERSION MINOR	VERSION MAJOR

## 3.4. Ethernet / RS-232 Messages

### 3.4.1. Restore Default Configuration

#### MessageId = 0x14

Reset the default communication configuration – IP address, mask, port and default gateway. After issuing this command, you must restart the device for changes to apply.

Request: Message without data.

Response: acknowledge.

### 3.4.2. Read and Write Configuration

#### MessageId = 0x15 for read, 0x16 for write

This command is used for changing IP address, mask and communication port all in one step. After writing the configuration, you must restart the device for changes to apply.

The read variant is for reading IP address, mask, port and MAC address. The difference is that you cannot write the MAC address. See the next subchapter for IP address and mask formats.

Request 0x15:

No data

Response:

DATA 0 – DATA 3	DATA 4	DATA 5 – DATA 6	DATA 7 – DATA 12
IP address	Mask	Port	MAC Address

Request for 0x16:

DATA 0 – DATA 3	DATA 4	DATA 5 – DATA 6
IP address	Mask	Port

Response: acknowledge.

### 3.4.3. Read and Write IP Address Configuration

#### MessageId = 0x17 for read, 0x18 for write

This command is for reading or writing device IP address and subnet mask. IP address octets are in the order first to last, e.g. 192.168.1.100 is encoded as C0 A8 01 64. Mask is in the one number format, which determines how many non-zero bits there is. For example, 24 corresponds with mask 255.255.255.0 (1111 1111.1111 1111.1111 1111.0000 0000). After issuing this command, you must restart the device for changes to apply.

Request 0x18:

DATA 0 – DATA 3	DATA 4
IP address	Mask

Response: acknowledge.

Response to ID 0x17 has same structure as request 0x18 above.

#### *3.4.4. Read and Write Communication Port*

##### **MessageId = 0x19 for read, 0x1A for write**

This command is for changing the application communication port. Default port is 8000. After issuing this command, you must restart the device for changes to apply.

Request 0x1A:

<b>DATA 0 – DATA 1</b>
Port

Response: acknowledge.

Response to 0x19 has the same structure as request for 0x1A above.

#### *3.4.5. Read MAC Address*

##### **MessageId = 0x1B**

This command is for reading device MAC address. Each device has unique MAC address which cannot be changed by the user. MAC address octets are in the order first to last, e.g. A0:19:6E:C2:A5:FC is encoded as A0 19 6E C2 A5 FC.

Request 0x1B:

No data

Response:

<b>DATA 0 – DATA 5</b>
MAC address

### 3.4.6. Read and Write Default Gateway

#### MessageId = 0x1C for read, 0x1D for write

Used for reading / changing the default gateway. Value in default configuration is 0.0.0.0 (in standard environment, default gateway is not needed as it is assumed that communication is running in single network segment). IP address octets are in the order first to last, e.g. 192.168.1.100 is encoded as C0 A8 01 64.

After issuing this command, you must restart the device for changes to apply.

Request 0x1D:

DATA 0 – DATA 3
Default gateway IP address

Response:

No data

Response to 0x1C has the same structure as request for 0x1D above.

### 3.4.7. Read and Write DHCP Enable / Disable

#### MessageId = 0x1E

Reading and writing of DHCP client enable. When DHCP is enabled, issuing IP address, mask or default gateway read means reading the currently active network value.

Request for read:

DATA 0
0x0

Response:

DATA 0
DHCP enable 0x00 – Disabled 0x01 – Enabled

Request for write:

DATA 0
0x01 – disable 0x02 – enable

Response: No data

### 3.5. LIN Messages

The LIN gateway can act as:

- LIN Master
- LIN Slave
- LIN bus Sniffer (receives all LIN communication and forwards into onto the Ethernet / USB)

The gateway can be controlled by a binary protocol over Ethernet / USB. This allows the user to:

- Configure LIN channel (Master/Slave, Baud Rate)
- Transmit and Receive LIN frames
- Acts as a sniffer - all LIN communication is forwarded onto Ethernet / USB

The sniffing mode does not actively communicate over the LIN bus. Instead, it forwards all incoming LIN communication onto the Ethernet / USB port.

The LIN channel configuration can be stored into the internal EEPROM. The configuration is then automatically loaded on power-up.

The LIN Id is a 6-bit LIN message identifier with the range of 0 – 63 (0x00 – 0x3F). The *LIN Id* keyword used in the following chapters is **always** 6-bit, even though it is not explicitly stated in next chapters.

#### LIN Frame Naming Convention

LIN frame consists of a header and a response.

**Header** = Synch. Break + Sync. Field + Id Field

**Response** = Data bytes + Checksum

Name	Meaning
<b>Master Response</b>	a complete LIN frame which contains both header and response
<b>Master Request</b>	a LIN header only e.g. Master transmits a header and expects a Slave to answer by a Slave response
<b>Slave Response</b>	a Slave Response only e.g. Databytes + Checksum

The following table summarizes TX/RX possibilities of the gateway for both LIN Master and Slave mode:

LIN Message Action	LIN Mode	
	Master	Slave
<b>Transmit Master Response</b>	yes	
<b>Transmit Master Request</b>	yes	

<b>Transmit Slave Response</b>		yes
<b>Receive Slave Response</b>	yes	
<b>Receive LIN Frame</b>	yes	yes

When the gateway is configured as LIN Master, an internal 1 kOhm pull-up resistor between Vbat and LIN bus is automatically enabled.

### 3.5.1.LIN Channel Configuration

#### MessageId=0x20

This command is for configuration of LIN interface. The Enhanced Checksum can't be selected when **AMLR == 0**. The LIN interface supports three baud rates (9600, 10417 and 19200).

Request:

<b>DATA 0</b>
Configuration Register

Configuration Register:

bit 7							bit 0
TX_ECHO	CHECKSUM	AMLR	AUTOSTART	MODE1	MODE0	BAUD1	BAUD0

- Bit 7            **TX echo**  
1 – TX echo enabled  
0 – TX echo disabled
  
- Bit 6            **Checksum Type**  
0 – Classical Checksum  
1 – Enhanced Checksum (except for 0x3C and 0x3D identifiers)
  
- Bit 5            **AMLR - Automatic Message Length Recognition**  
0 – Message length is taken from LIN Id field (as defined in LIN v1.x)  
1 – Message length is recognized automatically (variable datalength as defined in LIN v2.x)
  
- Bit 4            **AutoStart**  
0 – LIN channel is NOT automatically started on power-up  
1 – LIN channel is automatically started on power-up
  
- Bit 2..3        **Mode**  
00 – Slave  
01 – LIN Master  
10 – Sniffing Mode  
11 – Reserved
  
- Bit 0..1        **Baud rate**  
00 – Reserved  
**01 – 9600 Bd**  
**10 – 19200 Bd**  
**11 – 10417 Bd**

Response:

**No data**

General error message in case of error. Gateway cannot be reconfigured.

Reasons for error: Wrong baud rate type selected.

#### Default configuration of gateway

- Master
- Enhanced checksum
- 19200 Baud
- Auto-start disabled
- Automatic Message Length Recognition

#### *3.5.2. Read Configuration*

##### **MessageId=0x21**

This command reads LIN interface configuration register.

Request:

No data

Type of response:

<b>DATA 0</b>
Configuration Register

#### *3.5.3. Save Configuration*

##### **MessageId=0x22**

This command saves LIN interface configuration register to EEPROM.

Request:

No data

Response:

No data

#### *3.5.4. Load Configuration*

##### **MessageId=0x23**

This command loads saved configuration register from EEPROM.

Request:

No data

Response:

No data

#### *3.5.5. Default Configuration*

##### **MessageId=0x24**

This command loads default interface parameters.

Request:

No data

Response:

No data

#### Default configuration of gateway

- Master

- Enhanced checksum
- 19200 Baud
- Auto-start disabled
- Automatic Message Length Recognition

### 3.5.6. Start LIN

This command starts LIN interface.

**MessageId=0x30**

Request:

No data

Response:

No data in case of successful LIN start, general error message in case of error.

### 3.5.7. Stop LIN

This command stops LIN interface.

**MessageId=0x31**

Request:

No data

Response:

No data

### 3.5.8. Configure Echo LIN

This command setup LIN echo. When TX echo is on, all transmitted messages will be echoed back. If is TX echo off, no TX message will be echoed back. Same with RX echo for received messages. Default setting is TX echo enabled; RX echo enabled.

**MessageId=0x32**

Request:

<b>DATA 1</b>
Echo configuration

bit 7								bit 0
Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	TXECHO	RXECHO	

- |       |   |
|-------|---|
| Bit 1 | <p><b>TX Echo on/off</b></p> <p>0 – Echo Off</p> <p>1 – Echo On (default)</p> |
| Bit 0 | <p><b>RX Echo on/off</b></p> <p>0 – Echo Off</p> <p>1 – Echo On (default)</p> |

Response:

No data

### 3.5.9. LIN Error

#### MessageId = 0x33

This message is sent asynchronously when there is some error on LIN.

Response:

DATA 0	DATA 1
Error type	LIN ID related to error

Error type:

- 0: Checksum error
- 1: Bus error
- 2: Timeout overrun
- 3: Error data too long

### 3.5.10. Transmit Master Response

#### MessageId=0x40

The gateway will transmit a LIN frame (both LIN Header and Response) onto the LIN bus.

Request:

DATA 0	DATA 1	DATA 2	DATA 3	DATA n
LIN ID	LIN DATALEN	LIN DATA 0	LIN DATA 1	DATA n

Response:

No data

If echo enabled after the data are sent the message with same data structure as request is send.

Error response: General error message or LIN Error message in case of error.

Reasons for error: Channel is in stop state or buffer is full.

### 3.5.11. Transmit Master Request

#### MessageId=0x41

The gateway will transmit a LIN Header onto the LIN bus and will expect a Slave to send a response.

Request:

DATA 0
SLAVE LIN ID

DATA0 – LIN ID of slave device

Response:

No data

If echo enabled after the data are sent the message with same data structure as request is send.

Error response:

General error message or LIN Error message in case of error.

Reasons for error: Request cannot be sent, or slave doesn't respond.

### 3.5.12. Receive Master Response

**MessageId=0x42**

The gateway received a Slave response onto previously sent Master request.

Response:

DATA 0	DATA 1	DATA 2	DATA n
LIN ID	LIN DATALEN	LIN DATA 0	LIN DATA n

Error response: General error message or LIN Error message in case of error. Request cannot be sent, or slave doesn't respond.

### 3.5.13. Set LIN Diagnostic Timing (UDS Transport)

**MessageId = 0x45**

Set values for P2 and STmin parameters. P2 is time between last diagnostic response and first request (basically delay for the slave to be able to provide response). STmin is a minimum time between consecutive diagnostic requests or diagnostic responses. Note that those values are specified in the slave device's LDF file. Both parameters are 16-bit millisecond values. This message can be issued any time.

Default values for both parameters are 50 ms.

DATA 0	DATA 1	DATA 2	DATA 3
STmin LSB	STmin MSB	P2 LSB	P2 MSB

Response:

No data

If data length is correct, this command always succeeds.

### 3.5.14. LIN Diagnostic Request (UDS Transport)

**MessageId = 0x46**

Create and send LIN UDS request on the bus. Request has LIN Id 0x3C. It may be transmitted using multiple LIN frames depending on data length of the request. Device then automatically polls the slave for response on LIN Id 0x3D.

Note that this command can be used only when LIN is started and when device is configured as LIN Master.

DATA 0	DATA 1	DATA 2	...	DATA N
Device NAD	SID	UDS Data 1	...	UDS Data N – 1

- Device NAD: UDS NAD of the addressed device. This is also used to match the device response with the original request.
- SID: Service Identifier (e.g., 0x22 for Read Data by Identifier)
- UDS Data 0 ... N – 1: UDS data to be sent on the bus

Data length does not have to be specified as it is determined from the protocol message length.

Response:

**No data**

Error response: General error message or LIN Error message in case of error

### 3.5.15. LIN Diagnostic Response (UDS Transport)

**MessageId = 0x47**

Transmitted asynchronously when slave UDS response on LIN Id 0x3D was received. Response can span multiple LIN frames depending on data length. Note that our device listens only for NAD that was specified in the request message. When no slave responds, LIN error frame is echoed.

Format:

DATA 0	DATA 1	DATA 2	...	DATA N
UDS NAD	RSID	Raw UDS Data 0	...	Raw UDS Data N – 2

### 3.5.16. Slave Response Configuration

**MessageId=0x50**

When the gateway is configured as LIN Slave, it provides message buffers for Slave Responses. These message buffers can be used for both direction - transmission and reception of Slave Response.

The following describes how the message buffers can be set up.

Request:

DATA 0	DATA 1	DATA 2	DATA 3	DATA n
BUFFER CONFIG	LIN DATALEN	LIN DATA 0	LIN DATA 1	LIN DATA n

- LIN ID has to be unique
- Slave response buffers are empty after channel start
- LIN DATALEN can be up to 8
- LIN DATA bytes are present for TX direction only

**DATA 0 – BUFFER CONFIG:**

bit 7		bit 0	
Reserved	BUFFER DIR	LIN ID	

Bit 7    Reserved

**Bit 6 Buffer Direction**

0 – RX, the gateway will receive data from LIN frame into this buffer. Length of received message depends on AMLR bit from configuration register. If AMLR bit is 0, message length is hardcoded in LIN ID, otherwise length of the message is recognized automatically. See 3.5.18 for notification about this event.

1 – TX, the gateway will transmit a Slave Response when the corresponding LIN Id is pooled by the Master. See 3.5.18 for notification about this event.

Bit 0..5 LIN ID (including message length coding if AMLR bit is 0)

**DATA 1 – LIN DATALEN:**

Number of LIN data bytes (0-8)

**DATA 2, 3, 4... - LIN DATA (message data bytes)**

The data bytes shall only be present for TX Buffer Direction.

**Slave response buffer configuration example:**

DATA 0		DATA 1	DATA 2, DATA 3, DATA 4, DATA n	Comment:
<i>BUFFER DIR + LIN ID</i>		<i>LIN DataLen</i>	<i>LIN Data Bytes</i>	
1	0x01	4	0x01, 0x02, 0x03, 0x04	This data will be sent to LIN BUS if slave receives MASTER REQUEST with LIN ID 0x01
0	0x02	0	-	Slave will receive data from master and send them to PC.
1	0x05	2	0x22,0x23	This data will be sent to LIN BUS if slave receives MASTER REQUEST with ID 0x05

Response:

Data written to the Slave Response buffer

No data

Error response: General error message in case of error. Data cannot be written to the Slave Response buffer

Reasons for error: Buffer Direction is 1 (TX) but the DataLen is 0.

*3.5.17. Slave Response TX***MessageId=0x51**

When the gateway is configured as a Slave and it transmits a Slave Response onto the bus, it sends a notification to the user, if TX echo is enabled.

Response:

**Transmitted Slave Response onto the bus**

DATA 0	DATA 1	DATA 2	DATA n
LIN ID	LIN DATALEN	LIN DATA 0	LIN DATA n

Error response: General error message or LIN Error message in case of error.

*3.5.18. Slave Response RX***MessageId=0x52**

When the gateway is configured as a Slave and it receives a Master Response from the bus, it sends a

notification to the user, if RX echo is enabled.

Response:

Received data from Slave Response from the bus

DATA 0	DATA 1	DATA 2	DATA n
LIN ID	LIN DATALEN	LIN DATA 0	LIN DATA n

Error response: General error message or LIN Error message in case of error.

### 3.5.19. LIN Event

**MessageId=0x53**

When the gateway is configured as a Master, it sends a notification to the user when event occur.

Response:

**Transmitted Response onto the bus**

DATA 0
LIN EVENT

DATA 0	LIN event
0x0	LIN wake up signal
0x1 – 0xFF	Reserved

## 3.6. CAN and CAN FD Messages

### 3.6.1. Channel Configuration

**MessageId=0x60**

This message configures a CAN(/FD) channel. The time quanta for CAN FD controller are chosen by given sample point and baud rate. Sample point can be set exactly for baud rates up to 2 MBd. For 4 MBd, sample point is rounded to nearest lower multiple of 5 %; for 8 MBd, sample point is rounded to nearest lower multiple of 10 %. **Note** that for Data baud rate of 8 MBaud, Arbitration baud rate 1 MBaud should be used. The actual time quanta setting can be obtained by **Read Configuration** command. The CAN FD controller clock is 80 MHz.

Request:

Data section of a packet:

### 3.6.4. Save Configuration

#### MessageId=0x63

Saves CAN configuration to the non-volatile memory.

Request 0x63:

DATA 0
Channel number

Bit 0..1	Channel
	00 – CAN 1
	01 – CAN 2
	10 – Reserved
	11 – Reserved

Response:

DATA 0
Channel number

Acknowledgment when configuration was saved, general error message in case of error.

### 3.6.5. Load Configuration

#### MessageId=0x64

Request 0x64:

DATA 0
Channel number

Bit 0..1	Channel
	00 – CAN 1
	01 – CAN 2
	10 – Reserved
	11 – Reserved

Response:

DATA 0
Channel number

Acknowledgment when configuration was loaded, general error message in case of error.

### 3.6.6. Default Configuration

#### MessageId=0x65

Apply CAN default configuration. For default configuration values see 3.6.1 Channel Configuration.

Request 0x65:

DATA 0
Channel number

Bit 0..1	Channel
	00 – CAN 1
	01 – CAN 2
	10 – Reserved
	11 – Reserved

Response:

DATA 0
Channel number

Acknowledgment when configuration was loaded, general error message in case of error.

Reasons for error: wrong channel selected, CAN channel is already running.

### 3.6.7. Frame Echo Configuration

#### MessageId=0x66

Request 0x66:

DATA 0	DATA 1
Channel number	Echo configuration

bit 7							bit 0
Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	TXECHO	RXECHO

|               |  |                | ...                 |
|               |  |                | 0xFE – Reserved     |
|               |  |                | 0xFF – All Channels |

Response:

DATA 0
Channel number

Acknowledgment when channel was successfully stopped, error message when error occurred (for example wrong channel number).

Note: if all channels are selected for starting and one of the channels is running, no error is returned. Otherwise, if start of a running channel is requested, it is considered an error.

### 3.6.9. Stop Channel

#### MessageId=0x68

Stop CAN channel.

Request:

DATA 0
Channel number

Bit 0..7      **Channel**  
 0x0 – CAN 1  
 0x1 – CAN 2  
 0x2 – Reserved  
 ...  
 0xFE – Reserved  
 0xFF – All Channels

Response:

DATA 0
Channel number

Acknowledgment when channel was successfully stopped, error message when error occurred (for example wrong channel number).

### 3.6.10. Get Channel Timestamp

#### MessageId=0x69

Timestamp is 64bit number that represent the time from startup of CAN(/FD) channel in microseconds. The bit order in message is LSB.

Request:

DATA 0
Channel number

Bit 0..7      **Channel**  
 0x0 – CAN 1  
 0x1 – CAN 2  
 0x2 – Reserved  
 ...  
 0xFE – Reserved  
 0xFF – All Channels

Response:

DATA 0	DATA 1...8
Channel number	Timestamp byte 0...7

If all channels option is set

Response:

DATA 0	DATA 1...8	DATA 9	DATA 10...17
Channel 0	Timestamp byte 0...7	Channel 1	Timestamp byte 0...7

### 3.6.11. Transmit Frame

#### MessageId=0x6A

This message transmits CAN frame. The structure of frame is different when Extended ID is set. Without extended ID frame is header is 5 bytes long. With Extended ID is 7 bytes long. The format of ID is LSB.

Request:

**IF EXTId==0**

DATA 0	DATA 1	DATA 2	DATA 3	DATA 4	DATA n
Channel number	MESSAGE_INFO	ID0	ID1	DLC	DATA

**IF EXTId==1**

DATA 0	DATA 1	DATA 2	DATA 3	DATA 4	DATA 5	DATA 6	DATA n
Channel number	MESSAGE_INFO	ID0	ID1	ID2	ID3	DLC	DATA

Channel:

Bit 0..1	<b>Channel</b>
	00 – CAN 1
	01 – CAN 2
	10 – Reserved
	11 – Reserved

MESSAGE\_INFO:

bit 7							bit 0
Reserved	Reserved	Reserved	FDL	ESI	BRS	RTR	EXTId

Bit 5..7	<b>Reserved</b>
Bit 4	<b>FDL</b> 0 – Frame transmitted in Classic CAN format 1 – Frame transmitted in FDCAN format
Bit 3	<b>ESI</b> 0 – Transmitting node is error active 1 – Transmitting node is error passive
Bit 2	<b>BRS</b> 0 – FDCAN frames transmitted/received without bit rate switching 1 – FDCAN frames transmitted/received with bit rate switching
Bit 1	<b>RTR</b> 0 – Data frame 1 – Remote frame
Bit 0	<b>EXTId</b> 0 – Standard ID 1 – Extended ID

#### Timestamp

Timestamp is 64bit number that represents the time from startup of CAN(/FD) channel in microseconds. The bit order in message is LSB.

Response:

DATA 0
Channel number

Acknowledgment if the frame was successfully passed to the controller for transmission, general error message in case of error.

Possible reasons for error: wrong bit configuration.

IF the TX echo is enabled this message is received after the CAN frame is transmitted (EXTId==0):

DATA 0	DATA 1	DATA 2...9	DATA 10	DATA 11	DATA 12	DATA 13 - n
Channel number	MESSAGE_INFO	Timestamp byte 0...7	ID0	ID1	DLC	DATA

IF the TX echo is enabled this message is received after the CAN frame is transmitted (EXTId==1):

DATA 0	DATA 1	DATA 2...9	DATA 10	DATA 11	DATA 12	DATA 13
Channel number	MESSAGE_INFO	Timestamp byte 0...7	ID0	ID1	ID2	ID3
DATA 14	DATA 15 - n					
DLC	DATA					

### 3.6.12. Receive Frame

#### MessageId=0x6B

Message response has similar structure as Transmit Frame. It only differs with added timestamp bytes (bytes 2...9). Timestamp is 64bit number that represents the time from startup of CAN(/FD) channel in microseconds. The bit order in message is LSB. For this message no request is needed, it appears when frame from other CAN unit arrived.). Upon reception of CAN error frame, protocol error frame message is sent 0

CAN Error Frame.

Response:

**IF EXTId==0**

DATA 0	DATA 1	DATA 2...9	DATA 10	DATA 11	DATA 12	DATA 15 - n
Channel number	MESSAGE_INFO	Timestamp byte 0...7	ID0	ID1	DLC	DATA

**IF EXTId==1**

DATA 0	DATA 1	DATA 2...9	DATA 10	DATA 11	
Channel number	MESSAGE_INFO	Timestamp byte 0...7	ID0	ID1	
DATA 12	DATA 13	DATA 14	DATA n		
ID2	ID3	DLC	DATA		

### 3.6.13. CAN Error Frame

#### MessageId = 0x6C

This message is sent asynchronously when there is some error on CAN.

Response:

DATA 0	DATA 1	DATA 2...9
Channel number	Error type	Timestamp byte 0 – 7

Channel number: Always 0

Error type:

- 0: Bit Stuff Error
- 1: Form Error
- 2: Acknowledge Error
- 3: Bit Error
- 4: CRC Error

Timestamp: 64bit number representing duration in microseconds from channel start.

### 3.6.14. CAN Diagnostic RX Configuration (ISO-TP)

**MessageId = 0x70**

Request 0x70:

DATA 0	DATA 1	DATA 2	DATA 3	DATA 4	DATA 5	DATA 6	DATA 7
Channel number	ID LSB	ID MidB 0	ID MidB 1	ID MSB	Config byte	N_Br LSB	N_Br MSB

**Channel number:** CAN channel index.

**ID:** UDS CAN ID

**Config byte:**

bit 7						bit 0	
Reserved	Reserved	Reserved	Reserved	Reserved	Mixed Addressing	Extended Addressing	ExtID

Bits 7..3

**Reserved**

Bit 2

**Mixed Addressing**– Byte [0] of all the diagnostic messages on the bus is treated as Address Extension

Bit 1

**Extended Addressing**– Byte [0] of all the diagnostic messages on the bus is treated as Target Address

Bit 0

**Extended ID** – Use extended CAN ID

**N\_Br:** Time until transmission of the next Flow Control frame when First Frame is received. When set to 0, Flow Control is sent right away. Maximum value is 900 ms, if large value is provided, 900 ms is used.

See below for more details of the communication.

### 3.6.15. CAN Diagnostic TX Configuration (ISO-TP)

**MessageId = 0x71**

Request 0x71:

DATA 0	DATA 1	DATA 2	DATA 3	DATA 4	DATA 5	DATA 6
--------	--------	--------	--------	--------	--------	--------

Channel number	ID LSB	ID MidB 0	ID MidB 1	ID MSB	Config byte	Address Extension
----------------	--------	-----------	-----------	--------	-------------	-------------------

**Channel number:** CAN channel index.

**ID:** UDS CAN ID

**Config byte:**

bit 7							bit 0
Reserved	Padding	BRS	FD	Echo	Mixed Addressing	Extended Addressing	ExtID

Bit 7	<b>Reserved</b>
Bit 6	<b>Padding</b> – Enable or disable CAN frame data padding (CAN frame data length always set to 8, unused bytes are filled with 0xCC)
Bit 5	<b>BRS</b> – Use BRS for the requests (when FD is 0, this must be 0)
Bit 4	<b>FD</b> – Use CAN FD frames (64-byte data length). Possibility of CAN FD frames is determined by general CAN channel configuration.
Bit 3	<b>Echo</b> – Enable or disable TX echo
Bit 2	<b>Mixed Addressing</b> – Address Extension byte from configuration is inserted to byte [0] of all the diagnostic messages on the bus (when Extended Addressing is 1, this must be 0)
Bit 1	<b>Extended Addressing</b> – Target Address from the request is inserted to byte [0] of all the diagnostic messages on the bus (when Mixed Addressing is 1, this must be 0)
Bit 0	<b>Extended ID</b> – Use extended CAN ID

**Address extension:** When Mixed Addressing is enabled, this byte is inserted at the beginning of the diagnostic messages according to DoCAN specification. Otherwise, this is ignored.

### 3.6.16. CAN Diagnostic Change RX State (ISO-TP)

**MessageID = 0x72**

This command must be issued to enable parsing of diagnostic communication. Note that device transmits echo only from valid frames, there is no error information available.

When this is enabled, device filters out CAN traffic that uses the configured RX CAN ID and transmits only echo from the valid communication (meaning that 3.6.12 Receive Frame is not used for those CAN IDs). Furthermore, when this is enabled, device automatically transmits needed Flow Control frame when it detects it can receive some data.

When this is enabled, P2<sub>CAN\_Client</sub> timing parameter can be set – timeout from successful transmission of a DoCAN request message to the start of incoming response message. If set to 0, it is not used.

Request:

DATA 0	DATA 1	DATA 2	DATA 3
Channel number	Enable	P2 <sub>CAN_Client</sub> LSB	P2 <sub>CAN_Client</sub> MSB

Channel number: CAN channel index.

Enable: 1 for enabling parsing of diagnostic traffic, 0 for disabling it.

P2<sub>CAN\_Client</sub>: Millisecond timeout from successful transmission of request message to reception of response message. Max value: 32767

### 3.6.17. CAN Diagnostic Request (ISO-TP)

**MessageId = 0x73**

Transmit a diagnostic request on the bus. Note that CAN channel must be started beforehand. Transmission configuration is set using message CAN Diagnostic TX Configuration (ISO-TP). When diagnostic communication is active, CAN frame echo on specified CAN IDs is disabled.

Request 0x73:

DATA 0	DATA 1	DATA 2	...	DATA N
Channel number	TA	Diagnostic data [0]	...	Diagnostic data [N – 2]

Channel number: CAN channel index.

TA: Target address. When Extended Addressing is enabled in the configuration, this is inserted to the messages per DoCAN specification; otherwise, it is ignored.

Diagnostic data [0..N – 2]: Diagnostic data to be sent on bus

When TX echo is enabled, after transmission, this is echoed:

DATA 0	DATA 1	DATA 2	DATA 3	...	DATA N
Channel number	TA	AE	Diagnostic data [0]	...	Diagnostic data [N – 3]

Channel number: Set per request.

TA: Target address from the request.

AE: Configured Address Extension, when Mixed Addressing is not used, this is set to 0xFF.

Diagnostic data: data from the request.

### 3.6.18. CAN Diagnostic Response (ISO-TP)

**MessageId = 0x74**

This message is transmitted asynchronously when device receives a diagnostic response. It is similar to Diagnostic Request, only difference is that there is added Address Extension (note that its value is valid only when Mixed Addressing is used). Reception must be enabled using message CAN Diagnostic Change RX State (ISO-TP).

Request: Not possible

Response 0x74:

DATA 0	DATA 1	DATA 2	DATA 3	...	DATA N
Channel number	TA	AE	Diagnostic data [0]	...	Diagnostic data [N – 3]

**Channel number:** CAN channel index

**TA:** Target Address. Valid when Extended Addressing is enabled in the configuration, otherwise always set to 0xFF.

**AE:** Address Extension. Valid when Mixed Addressing is enabled in the configuration, otherwise always set to 0xFF.

**Diagnostic data [0..N – 2]:** Diagnostic data to be sent on bus

### 3.6.19. CAN Diagnostic Timeout (ISO-TP)

**MessageId = 0x75**

This message is transmitted asynchronously when diagnostic timeout occurs.

Request: Not possible

Response 0x75:

DATA 0	DATA 1
Channel number	Reason

Channel number: CAN channel index

Reason: when the timeout occurred

- 0x01: No Consecutive Frame was received after Flow Control was transmitted (N\_Cr timeout)
- 0x02: No Flow Control frame received after First Frame was transmitted (N\_Bs timeout)
- 0x03: No diagnostic message reception after request was transmitted (configurable timeout  $P2_{CAN\_Client}$ )

### 3.7. IO Control Messages

#### 3.7.1. Write Digital Output

**MessageId = 0xE0**

Message for controlling 5V push-pull output. Least significant bit of data byte 0 controls the output (0 off, 1 on).

Request:

DATA 0	
X [7:1]	Status [0]
7 b	1 b

Response:

No data

#### 3.7.2. Read Analogue Input

**MessageId = 0xE1**

Message for reading voltage value of the analogue input. Maximum input voltage is 5 V. Value is two-byte voltage measurement in millivolts and it is transmitted LSB first.

Request:

No data

Response:

DATA 0	DATA 1
Value LSB	Value MSB

## 3.8. Miscellaneous Messages

### 3.8.1. Restart Device

**MessageId = 0xFD**

Issuing this command makes the device restart. Restart is needed after changing IP address or port.

Request, response:

No data

### 3.8.2. Restart Device to Bootloader

**MessageId = 0xFE**

This command restarts device to System Bootloader, so that new firmware can be loaded. It can be chosen which bootloader will be started: System Bootloader for connection via USB and STM32CubeProgrammer or HTTP bootloader for upload from web browser. Recommended web browser for firmware upload is Google Chrome. File must be in the binary format (.bin).

Request:

DATA 0
Bootloader selection

- Bootloader selection: 0 = System bootloader, 1 = Web bootloader

Response

No data

## 4. Communication Examples

### 4.1. Device Settings

Command	Bytes [hex]
<b>Read SN</b>	<b>02 11 00 00 11 03</b> Example response: <b>02 11 04 00 00 01 02 03 1B 03</b> Serial number is 03020100 <u>Bytes explanation - request:</u> <b>02</b> – STX <b>11</b> – ID <b>00 00</b> – DATALEN <b>11</b> – Checksum <b>03</b> – ETX <u>Response:</u> <b>02</b> – STX <b>11</b> – ID <b>04 00</b> – DATALEN <b>00 01 02 03</b> – DATA <b>1B</b> – Checksum <b>03</b> – ETX
<b>Read MAC address</b>	<b>02 1B 00 00 1B 03</b> Example response: <b>02 1B 06 00 A7 19 6E C2 A5 FC B2 03</b> MAC address is A7:19:6E:C2:A5:FC
<b>Write Ethernet settings</b> IP address: 192.168.1.101 Mask: 24 (255.255.255.0) Port: 8001	<b>02 16 07 00 C0 A8 01 65 18 41 1F 63 03</b> Response: <b>02 16 00 00 16 03</b>
<b>Write default gateway</b> IP address: 192.168.1.100	<b>02 1D 04 00 C0 A8 01 64 EE 03</b> Response: <b>02 1D 00 00 1D 03</b>

## 4.3. USB – CAN interface

Command	Bytes [hex]
<b>Configure CAN channel</b> Channel 0, CAN, AutoStart, Normal mode, Arbitration SP = 80%, Arbitration Baud = 500 kBd, Arbitration SJW = 2, Data Baud = 2MBd, Data SJW = 1, Data SP = 80%	02 60 06 00 00 28 02 01 10 08 A9 03 Gateway response: 02 60 01 00 00 61 03
<b>Configure CAN channel timing</b> Channel 0, CAN, Normal mode, Arbitration T_seg1 = 15, Arbitration T_seg2 = 4, Arbitration Prescaler = 4, Arbitration SJW = 2, Data T_seg1 = 5, Data T_seg2 = 1, Arbitration SJW = 1, Data Prescaler = 1	02 61 09 00 00 00 0E 03 03 01 04 00 00 83 03 Gateway response: 02 61 01 00 00 62 03
<b>Start CAN channel</b> Channel 0	02 67 01 00 00 68 03 Gateway response: 02 67 01 00 00 68 03
<b>Transmit CAN Frame</b> Channel 0, format = CAN, ID = 0x01FF, DLC = 7, Data (hex) = 05 04 50 06 06 08 14 , Tx echo disable	02 6A 0C 00 00 00 FF 01 07 05 04 50 06 06 08 14 FE 03 Gateway response: 02 6A 10 00 00 6B 03
<b>Stop CAN channel</b> Channel 0	02 68 01 00 00 69 03 Gateway response: 02 68 01 00 00 69 03

#### 4.4. USB – CAN FD interface

Command	Bytes [hex]
<b>Configure CAN FD channel</b> Channel 0, CAN FD, AutoStart, Normal mode, Arbitration SP = 80%, Arbitration Baud = 500 kBd, Arbitration SJW = 8, Data Baud = 2MBd, Data SJW= 4, Data SP = 80%	02 60 06 00 00 68 02 07 13 08 F2 03 Gateway response: 02 60 01 00 00 61 03
<b>Configure CAN FD channel timing</b> Channel 0, CANFD, AutoStart, Normal mode, Arbitration T_seg1 = 15, Arbitration T_seg2 = 4, Arbitration Prescaler = 8, Arbitration SJW = 6, Data T_seg1 = 5, Data T_seg2 = 1, Arbitration SJW = 1, Data Prescaler = 1	02 61 09 00 00 60 0E 03 03 01 0E 13 00 00 03 Gateway response: 02 61 01 00 00 62 03
<b>Start CAN FD channel</b> Channel 0	02 67 01 00 00 68 03 Gateway response: 02 67 01 00 00 68 03
<b>Transmit CAN FD Frame</b> Channel 0, format = CAN FD, BRS, ID = 0x01FF, DLC = 7, Data (hex) = 05 04 50 06 06 08 14, Tx echo disable	02 6A 0C 00 00 14 FF 01 07 05 04 50 06 06 08 14 12 03 Gateway response: 02 6A 01 00 00 6B 03
<b>Stop CAN FD channel</b> Channel 0	02 68 01 00 00 69 03 Gateway response: 02 68 01 00 00 69 03

#### 4.5. LIN Diagnostics

Suppose that on the LIN bus, there is connected a device with address 0x14 which responds on SID 0x22. Device is sleeping, so first request timeouts as the device wakes up, then it responds on the second request. This is how the communication could look like.

Command	Bytes [hex]
<b>Start LIN channel</b>	02 30 00 00 30 03 Gateway response: 02 30 00 00 30 03
<b>Set UDS timing</b> <b>Setting STmin = 50, P2 = 50</b>	02 45 04 00 32 00 32 00 AD 03 Gateway response: 02 45 00 00 45 03
<b>UDS request</b> Device wakeup	02 46 04 00 14 22 64 1F 03 03 Gateway response: 02 46 00 00 46 03
<b>Asynchronous LIN error</b> Error due to no response as the device was sleeping	Gateway response: 02 33 02 00 02 3D 74 03
<b>UDS request</b> <ul style="list-style-type: none"> <li>Device NAD 0x14</li> <li>SID 0x22</li> </ul>	02 46 04 00 14 22 64 1F 03 03 Gateway response: 02 46 00 00 46 03
<b>Asynchronous UDS response</b> Response from an example device. <ul style="list-style-type: none"> <li>Device NAD 0x14</li> <li>RSID 0x62</li> </ul>	02 47 08 00 14 62 64 1F 30 30 31 30 09 03

#### 4.6. CAN Diagnostics

Example of DoCAN communication. Presume that CAN channel was previously configured as needed.

Command	Bytes [hex]
<b>Start CAN channel</b> <b>Channel 0</b>	02 67 01 00 00 68 03 Gateway response: 02 67 01 00 00 68 03
<b>Disable CAN echo</b> Channel 0	02 66 02 00 00 00 68 03 Gateway response: 02 66 01 00 00 67 03
<b>DoCAN RX configuration</b> Channel 0 CAN ID 0x72C No mixed addressing, no extended addressing N_Br = 100 ms	02 70 08 00 00 2C 07 00 00 00 64 00 OF 03 Gateway response: 02 70 00 00 70 03
<b>DoCAN TX configuration</b> Channel 0 CAN ID 0x724 Enable TX echo Enable padding to 8 bytes	02 71 07 00 00 24 07 00 00 48 00 EB 03 Gateway response: 02 71 00 00 71 03
<b>DoCAN configure parsing</b> Channel 0 Enable parsing of diagnostic messages P2 <sub>CAN_Client</sub> = 1000 ms	02 72 04 00 00 01 E8 03 62 03 Gateway response: 02 72 00 00 72 03
